Give readers two ways to open a link

Create a practice flyer with a QR code and a readable web address. Test both routes before sharing it. Use the practice address instead of a private or personal link.

1. Generate your practice code

Open the SolveNook QR handout activity

Choose Website URL and enter https://example.org/. Select Generate QR code and check the encoded address. Download PNG or SVG and place the image in a document.

2. Label the destination

Write a short label that says what opens, followed by the readable address. Keep the empty border clear. If you share the flyer online, make the readable address a clickable link.

Label: _____

Address: _____

3. Check a print proof

Scan the code and type the printed address separately. Write the address each route opened. Compare the destination after following both routes.

Scanned: _____

Typed: _____

Discuss how someone who cannot scan the code could reach the same page.

Give readers two ways to open a link

A good flyer names the destination and provides a readable link to the same address. Use this sample as a reference before collecting learners' print proofs.

Sample flyer

Open the practice website

example.org

Expected checks

Both routes should open https://example.org/. In an online document the readable address should also open that destination when selected.

If a print scan fails, check the size, dark-on-light contrast and empty border. Print one new proof at the intended size before making copies.

Discussion: A readable address helps people who cannot scan or prefer to type the link. The descriptive label tells readers what they are opening.
